## PREFACE

ZIRCONIUM and hafnium have many interesting physical and mechanical properties such as corrosion resistance and mechanical strength of metals and alloys at both low and elevated temperatures. The transparency of zirconium to thermal neutrons has found its greatest use as a construction material in nuclear reactors. Hafnium is always associated with zirconium and their separation from each other remained a challenge to analytical chemists for several years. Hafnium has been used as control rods in nuclear reactors because of its large neutron cross-section. Less interest has been shown in the chemical and physical properties of hafnium through the years. This may, however, change as its applications widen. Hafnium can absorb and give up heat more than twice as fast as zirconium or titanium and seems very promising as a construction material for jet engines and space technology.

The monograph presents a collection and comparison of available literature on the characterization and analysis of zirconium and hafnium. The aqueous chemistry of zirconium and hafnium has been discussed to draw attention to the complications of hydrolysis and polymerization and their effect on analytical procedures. Classical methods such as gravimetric, titrimetric and absorptiometric are presented along with spectrographic, X-ray and neutron activation methods. Techniques for the separation, of zirconium from hafnium have been discussed. The monograph covers important literature up to 1967.

Thanks are due to Professor Henry Freiser for his valuable criticism of the manuscript.

# PHYSICAL PROPERTIES OF ZIRCONIUM AND HAFNIUM

| Property                                  | Zirconium   | Hafnium  |
|---|---|--|
| Atomic number                             | 40  | 72   |
| Atomic weight                             | 91.22   | 178.6  |
| Atomic radius                             | 1.452 Å   | 1.442 Å  |
| Ionic radius (M <sup>4+</sup> )           | 0.74 Å  | 0.75 Å   |
| Density                                   | Close-packed hexagonal structure, 6.489 g/cm <sup>3</sup> (low hafnium) to 6.574 g/cm <sup>3</sup> (high hafnium); body-centered cubic high-temperature structure at 979°C, 6.046 g/cm <sup>3</sup> | 13.09 ± 0.01 g/cm <sup>3</sup> at 20°C                                 |
| Melting point                             | 1852 ± 2°C  | 2222°C   |
| Boiling point                             | 3580°C  | 5400°C   |
| Vapor pressure                            | 1949–2054°K<br>$\log P \text{ (atm)} = \frac{31,066}{T} + 7.3551$<br>$- 2.415 \times 10^{-4} T$   | 10 <sup>-10</sup> atm at 1867°C;<br><br>10 <sup>-9</sup> atm at 2007°C |
| Thermal expansion                         | Alpha, 5.85 × 10 <sup>-6</sup> per °C for heterogeneously oriented polycrystals; body-centered cubic alpha, 9.7 × 10 <sup>-6</sup> per °C between 870 and 1337°C                                    | Alpha phase, 0.000519 per °C between 20 and 200°C                      |
| Thermal expansion perpendicular to C-axis | Alpha, 6.96 × 10 <sup>-6</sup> per °C   | —  |
| Specific heat                             | At room temperature, 0.067 ± 0.001 cal/g °C; above 862°C, 0.08 cal/g °C   | 0.0351 cal/g °C between 25° and 100°C                                  |
| Specific heat vs. temperature             | Between 1.8° and 4.2°K, C <sub>p</sub> = 6.92 × 10 <sup>-4</sup> T + 464.5 (T/265) cal/mole/°C. C <sub>p</sub> = 0.070 + 3.6 × 10 <sup>-6</sup> T cal/g °C  | —  |
| Latent heat of fusion                     | 5.5 kcal/mole (estimated)   | —  |
| Latent heat of vaporization               | 142,150 ± 350 cal/mole  | —  |

PHYSICAL PROPERTIES OF ZIRCONIUM AND HAFNIUM—*cont.*

| Property  | Zirconium  | Hafnium  |
|---|--|--|
| Thermal conductivity                              | At 24°C—, 0.211 W/cm °C<br>At 100°C—, 0.204 W/cm °C<br>At 300°C—, 0.187 W/cm °C<br>$K = 0.0308 (\rho - 0.00327)T + 0.0381$ ,<br>where $\rho$ is the electrical conductivity in reciprocal microhm-cm and $T$ is temperature in °K. | At 50°C, 0.233 W/cm °C   |
| Electrical resistivity at room temperature        | 40 microhm-cm  | 35.1 microhm-cm  |
| Temperature coefficient of electrical resistivity | $44 \times 10^{-4}$ per °C   | 0.0038 per °C  |
| Electrochemical equivalent                        | Valence 4,<br>0.2363 mg/coulomb  | Valence 4,<br>0.4626 mg/coulomb  |
| Superconductivity critical temperature            | 0.546°K in zero magnetic field   | —  |
| Paramagnetic susceptibility                       | At 25°C, $1.3 \times 10^{-6}$ cgs<br>At 700°C, $1.53 \times 10^{-6}$ cgs<br>At 862°C, $1.9 \times 10^{-6}$ cgs   | $0.42 \times 10^{-6}$ emu/g at 20°C  |
| Thermal neutron cross-section                     | 0.18 barns   | 105 barns  |
| Ionization potential                              | 34.33 eV for valence 3   | —  |
| Crystal structure                                 | Close-packed hexagonal at 25°C;<br>$a = 3.2312 \text{ \AA}$ $c = 5.1477 \text{ \AA}$ ,<br>$c/a = 1.5931$ ; body-centered cubic at 862°C; $a = 3.6090 \text{ \AA}$  | Close-packed hexagonal, alpha phase,<br>$a = 3.1883 \text{ \AA}$<br>$c = 5.0422 \text{ \AA}$ ;<br>body-centered cubic, beta phase,<br>$a = 3.50 \text{ \AA}$ . |
| Modulus of elasticity                             | $13.7 \times 10^6$ psi   | —  |
| Hardness  | 87–98 B  | 100 B  |
